

PRODUCT CATALOG 2018

Power semiconductors

ABB's success story in power electronics began more than 100 years ago with the production of mercury-arc rectifiers in Switzerland. Over the past 60 years, ABB has played a pivotal part in the development of power semiconductors and their applications.

ABB is a leading supplier of power semiconductors with production facilities in Lenzburg, Switzerland, and Prague, Czech Republic, as well as a research laboratory for wide bandgap semiconductors in Baden-Dättwil, Switzerland.

Exceeding quality requirements, guaranteeing reliability expectations and perpetual pioneering are our distinctions.

This product catalog provides an overview of ABB's full range of power semiconductors.

Additionally, a compilation of broad background information on our portfolio can be found in our product brochure.

Applications

ABB's power semiconductors are key components in a variety of demanding applications in markets like power transmission & distribution, industrial, transportation and renewable energy. Customers rely on ABB's high quality power semiconductor products and use them in applications in power ranges from 50 kW to 10 GW.

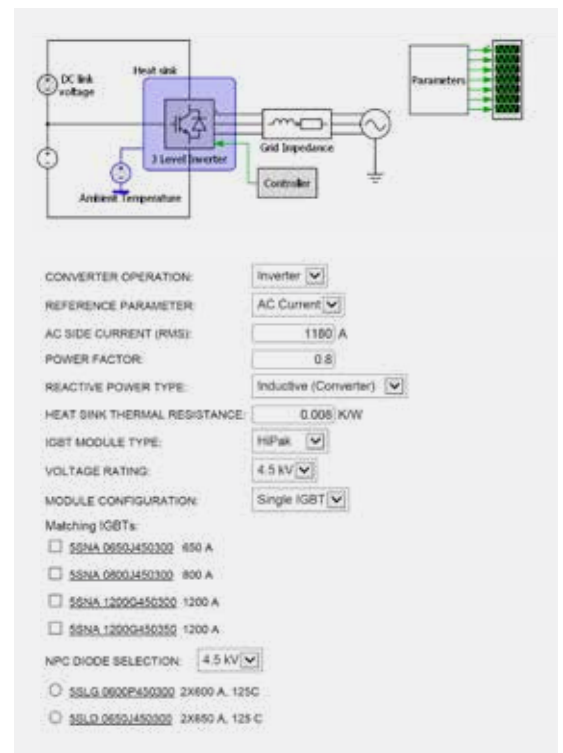

- ① Power transmission and distribution (HVDC, FACTS, STATCOM and others)
- ② Industry (medium and low-voltage drives, soft starters, UPSs, high-power rectifiers, excitation systems and others)

- ③ Transportation (main and auxiliary drives, trackside power supply)
- ④ Renewable energy (converters for pumped hydro, wind turbines and solar)

SEMIS

Semiconductor simulation tool

ABB's semiconductor simulation tool SEMIS is a sophisticated web application to evaluate the optimal choice of high power semiconductor in regards of thermal losses and device utilization. By selection of topology and definition of relevant circuit parameters, SEMIS performs an analysis of various system dependencies and evaluates thermal conditions enabling verification of semiconductors device capabilities.

Simulation results are presented in graphical and numerical form. With the steady-state analysis, temperature development is evaluated thus enabling the identification of most influencing components. A flexible variation of semiconductor devices enables optimization of the cost / benefit ratio. Output graphs indicate current, voltage,

power and temperatures according to the selected topology and settings.

The numerical results listed inform about power losses and junction temperatures of all semiconductor devices according to the load and customer defined thermal resistances of cooling.

SEMIS is suitable for initiates and experts and is straightforward to use. At first, you select the circuit of interest to indicate the input parameters. By entering circuit specific parameters, boundary conditions are set and the suited semiconductors are listed for selection. By selecting the desired ABB product and setting the overall system constraints, all parameters are set and the system is ready to start the simulation.

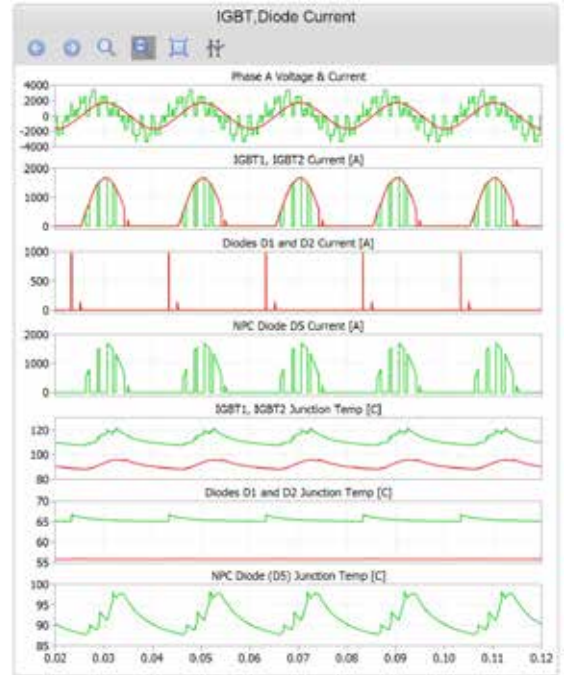

The SEMIS simulator calculates the on state and dynamic power losses and the thermal variations within the circuit, based on the specifications by Jacobian analysis. Excess of permissible thermal limits generates alert messages to ensure safe operation area for the specific semiconductor.

The detailed results are indicated in a table with all electrical losses and system efficiency indication, showing the influence of the semiconductor to the overall energy efficiency.

The thermal conditions combined with power loss enable the definition of the cooling system requirements.

As SEMIS is based on the PLECS simulation software, the device's thermal models (in XML format) are available for download from our website, allowing PLECS users the flexibility to simulate ABB products based on manufacturer's data, on their own.

For simulations exceeding the capabilities of the SEMIS simulation tool and simulation requirements of higher complexity, please contact us for further support.

Device Losses & Temperatures				
	Switching	Conduction	Combined Losses	Avg. Junction Temperature (T _J Avg)
IGBT1	1.665 kW	1.031 kW	2.696 kW	115 °C

Product outlook

Innovation and quality are key for success. It is our mission to drive innovation in power semiconductor technology together with our customers and to add value through best performance and quality. We strive to be the best and most forward-looking performer in our markets when it comes to reliability.

ABB Semiconductors' vast range of power semiconductors for industrial, power generation & distribution, traction and renewable energy markets will be expanded soon with the following new products:

6500 V 900 A HiPak with 150 °C operation temperature

The improved SPT⁺⁺ technology boosts the rating of the 6500 V IGBT from 750 to 900 A. In addition it allows the IGBT module to be operated up to $T_{vj}(op) = 150\text{ °C}$ with unrivaled robustness. For improved performance in regenerative mode we have increased the diode area by 20 %. This opens the potential to choose a smaller module size or eliminate parallel connection of modules.

Ratings of 6500 V SPT⁺⁺ HiPak

	Availability	Rating	Configuration	V_{CESat} (V) typ. 150 °C	V_F (V) typ. 150 °C	Housing
HiPak2 G	Samples Q2/18	6500 V 900 A	single IGBT	3.9	3.2	G (10.2 kV ISOL)
HiPak1 J	Samples Q3/18	6500 V 600 A	single IGBT	3.9	3.2	J (10.2 kV ISOL)

Enhanced Trench 3300 V 1800 A HiPak

ABB has combined the benefits of the very low loss and ultra rugged SPT⁺ technology with a latest trench cell design. This yields in further reduced losses and increased current density. Thus the new device allows an increase in rated current of 20 % compared to the previous 1500 A generation in the same housing. In addition the new 1800 A 3300 V HiPak is designed to cope with increased stray inductance values.

Ratings of new enhanced Trench HiPaks

	Availability	Rating	Configuration	V_{CESat} (V) typ. 150 °C	V_F (V) typ. 150 °C	Housing
HiPak2 E	Samples Q1/18 MP Q3/18	3300 V 1800 A	single IGBT	3.0	2.2	E
HiPak2 G	Samples Q1/18 MP Q4/18	3300 V 1800 A	single IGBT	3.0	2.2	G (10.2 kV ISOL)
HiPak1 N	Samples Q3/18	3300 V 1200 A	single IGBT	3.0	2.2	N

IGBT and diode dies

When looking for chipsets featuring highest switching performance, ruggedness and reliability, ABB's IGBT chips with accompanying diodes are certainly the preferred choice.

ABB Semiconductors' SPT (Soft Punch Through) chipsets and their improved versions with lower losses (SPT⁺ and SPT⁺⁺) are available at 1200 V and 1700 V. They feature highest output power per rated ampere due to a moderate chip shrinkage and thus larger die area compared to others.

Typical applications for 1200 V are power converters for industrial drives, solar energy, battery backup systems (UPS) and electrical vehicles. Applications for 1700 V also include industrial power conversion & drives, wind turbines and traction converters.

ABB's 1700 V SPT⁺⁺ chipset is the world's first 1700 V chipset that offers an operational junction temperature of up to 175 °C. This allows the module designer to increase the power density of the IGBT modules significantly.

Diode dies

Medium-power IGBT modules

ABB enhances its successful IGBT module range into the medium-power segment. Starting with the 62Pak and the LoPak1, ABB brings the proven high quality and reliability of the HiPak modules to the medium-power IGBT segment

- ABB's 62Pak modules have an advanced packaging technology that leverages the performance of the latest silicon technology:
- 1700 V SPT** fast switching IGBT / diode chipset with lowest switching losses
 - Full 175 °C operation temperature with full square SOA
 - Best-in-class temperature cycling performance of bond-wire chip connection
 - Standard package allowing drop-in replacement

ABB's LoPak is 100% mechanically compatible with the Econo-type dual IGBT modules. It sets a new benchmark with full switching performance up to 175 °C. It is specifically designed for excellent internal current sharing, offering optimal thermal utilization and increased robustness. Thus customers can expect larger safety margin and increased lifetime. Typical applications include:

- Wind power converters
- Variable speed drives
- Power supplies
- Power quality
- UPS
- Renewable energies

High-power IGBT and diode modules

ABB offers two categories of high-power IGBT and diode modules: Insulated and press-pack modules.

Insulated modules consist of the new innovative, low inductive phase leg LinPak and the well-established HiPak lineup with more than 15 years of successful track record.

Press-pack modules are a range of pressure contact IGBT modules also known as StakPak. StakPaks are ABB's flagship with record power ratings up to 4500 V and 3000 A.

ABB's high-power IGBT and diode module families are:

- LinPak IGBT modules page 16
- HiPak IGBT and diode modules page 18
- StakPak IGBT press-pack modules page 22

LinPak IGBT modules

The LinPak is a new innovative solution for all power conversion applications. It enables the design of converters with lowest overall inductance, thus fast low switching loss chipsets can be used for the first time also in high-current applications.

These applications include amongst others traction, converters for wind turbines or other renewables, industrial drives, as well as power electronics for FACTS applications. In addition, the LinPak allows very easy parallel connection, thus the current rating of the inverters can be scaled up with just one article number.

This makes the supply chain and initial device design-in efforts significantly more efficient.

ABB's LinPak modules feature lowest switching losses and excellent robustness thanks to its low inductance.

HiPak IGBT and diode modules

Demanding high-power applications such as traction inverters, medium-voltage drives, wind turbine converters, HVDC or FACTS are looking for the highest reliability IGBT modules.

ABB's HiPak family of IGBT modules is the best fit to demanding applications, continuing to set new standards of robustness.

ABB's HiPak IGBT modules are available from 1700 V to 6500 V in various configurations. They all feature low losses combined with soft-switching performance and record-breaking Safe Operating Area (SOA).

Configurations

StakPak IGBT press-pack modules

To enhance reliability and reduce cost in systems that require redundancy and series-connected IGBT modules, one should consider using ABB's StakPaks.

ABB's StakPak family uses a well proven concept in IGBT press-pack technology that:

- allows for easy mechanical and electrical series connection
- allows for easy stack design thanks to high tolerance for inhomogeneous mounting pressure
- guarantees a uniform chip pressure in multiple-device stacks
- provides a stable shorted state in case of failure
- long-term short-circuit failure mode (SCFM) available

ABB Semiconductors' StakPak IGBT modules are therefore a perfect match for applications like HVDC, FACTS, breakers and pulsed power.

Diodes

Diodes are used in a number of different applications. Each of these applications sets different requirements on the diodes' characteristics.

Inverter applications ask for fast recovery diodes with soft-switching characteristics, high-current rectifiers demand diodes with low on-state losses, medium-power rectifiers benefit from diodes with avalanche capability and welding rectifiers require highest current in the smallest package.

ABB offers four press-pack diode families that meet these requirements:

- Fast recovery diodes page 26
- Standard rectifier and avalanche diodes page 28
- Welding diodes page 32

Fast recovery diodes

ABB Semiconductors' comprehensive family of fast recovery diodes is optimized for enhanced Safe Operating Area (SOA) and controlled (soft) turn-off recovery. This makes these diodes very well suited for all converter applications.

ABB has a long history in producing high-power fast recovery diodes for applications such as Voltage Source Inverters (VSIs), Current Source Inverters (CSIs) and snubbers. The diodes are typically used in combination with IGCTs and GTOs as free-wheeling, snubber and clamp diodes, thus enabling full IGCT and GTO performance.

ABB particularly developed L-housing fast recovery diodes to optimally match press-pack IGBT and IEGT applications where a di/dt of up to 5 kA/μs is required.

Fast recovery diode recommendations for various applications can be found in the ABB application note - Applying fast recovery diodes. The latest version is available at www.abb.com/semiconductors.

Standard rectifier and avalanche diodes

ABB's two families of high-power rectifier diodes – standard rectifier diodes and avalanche diodes – are well-known for their outstanding reliability and excellent nominal and surge current capabilities.

The standard rectifier diodes are optimized for line frequency and low on-state losses. Their main applications are rectifiers for large AC drives, aluminum smelting and other metal refining as well as trackside supply.

The avalanche diodes are self-protected against transient overvoltages, offer reduced snubber requirements and feature maximum avalanche power dissipation. They are frequently used for input rectifiers in traction converters or high-voltage power rectifiers.

For safe and easy parallel or series connection, both types of diodes are available in groups of similar V_F or Q_{rr} , respectively.

Welding diodes

Almost every second car driving in Europe has been fabricated using ABB welding diodes, as most of the major welding equipment manufacturers rely on ABB's quality, reliability and performance.

ABB's comprehensive product range offers medium frequency (up to 2 kHz) and high frequency (up to 10 kHz) welding diodes. They all feature very low on-state voltage and very low thermal resistance. In addition, they are available in light package, thin and hermetically sealed ceramic housings or even housing-less, another welcomed feature for equipment that is mounted directly on robot arms.

Dimensions in mm

Thyristors

High-power thyristors are used in applications ranging from 100 kW drives up to HVDC stations rated above 10 GW.

Since many applications use antiparallel connected thyristors, ABB has introduced the bi-directionally controlled thyristor (BCT), which consists of two integrated antiparallel thyristor functions on one silicon wafer.

ABB offers the following thyristor families:

- Phase control thyristors (PCTs) page 35
- Bi-directionally controlled thyristors (BCTs) page 40

PCTs

Phase control thyristors

ABB Semiconductors' phase control thyristor has been the backbone of the high-power electronics industry since its introduction almost 50 years ago and has set benchmark reliability records over many years.

The field of PCT applications ranges from kW drives and MW rated line commutated frequency converters to GW converters for HVDC transmission.

ABB was the first company to introduce 6" thyristor products and offers the most complete range of high-power thyristors. New thyristor products continue to be developed with focus on minimizing overall losses and maximizing the power rating of the device.

Applications using two antiparallel thyristors can take advantage of ABB's innovative bi-directionally controlled thyristors (BCTs) that incorporate two antiparallel thyristors in a single housing (see page 40).

BCTs

Bi-directionally controlled thyristors

Improved volume consumption and reduced part count for SVC, 4-quadrant DC-drive or soft starter equipment in the magnitude of 25 percent compared with equally rated PCT-solutions are possible with ABB's BCTs – without jeopardizing reliability and performance.

ABB's innovative bi-directionally controlled thyristor (BCT) features two monolithically integrated antiparallel thyristors in a single housing. The two thyristor halves are individually triggered and have a separation region enabling the design of high-voltage devices with the dynamic capability of discrete devices.

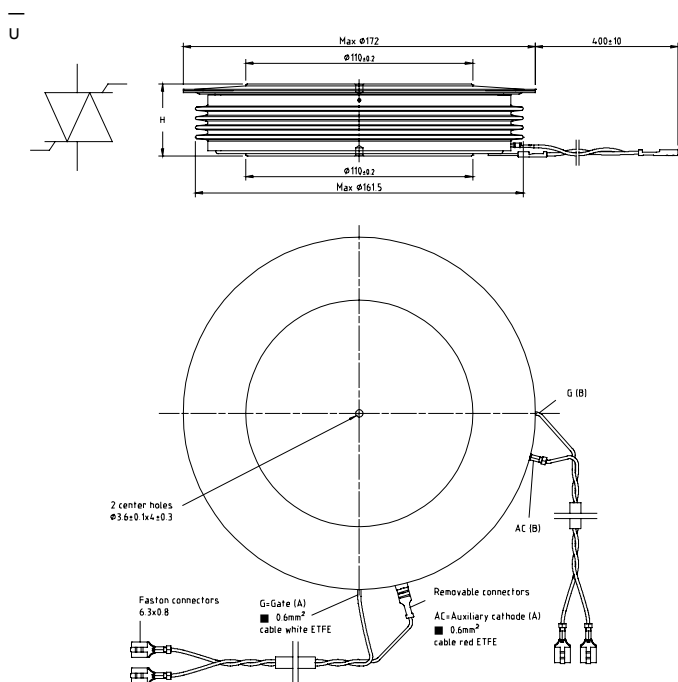

The BCT is designed, manufactured and tested using the same philosophy, technology and equipment as the well-established PCT (page 35), thus reaching the same levels of performance and reliability.

A table of replacement of PCTs by BCTs is given in the BCT application note which can be found at www.abb.com/semiconductors.

IGCTs

Integrated gate-commutated thyristors

Within 20 years of its introduction, the IGCT has established itself as the semiconductor of choice for high-power frequency converters by meeting the requirements of today's demanding applications.

ABB Semiconductors' IGCTs are used in a multitude of applications due to their versatility, efficiency and cost-effectiveness. With their low on-state voltage, they achieve the lowest running costs by reaching inverter efficiencies of 99.6 percent and more.

Single inverters of over 15 MVA can be realized without series or parallel connection, thus achieving the highest inverter power densities in the industry.

The number of applications featuring IGCTs is manifold: medium-voltage drives (MVDs), marine drives, co-generation, wind power converters and STATCOMs, to name just a few.

The latest record performance using IGCTs was achieved with the world's most powerful frequency converter (100 MVA) for variable speed pumped hydropower application that ABB has installed to the Grimsel 2 power plant in the Swiss Alps.

GTOs

Gate turn-off thyristors

One might be assuming that the rapid advance of the IGBT would spell an equally rapid end to the GTO era. The demand for these devices, however, is still strong today.

ABB offers a broad portfolio of asymmetric GTOs with proven field reliability in various traction and industrial applications.

Asymmetric GTOs are divided in two categories: Fine pattern and standard. Fine pattern GTOs with buffer layer have exceptionally low on-state and dynamic losses and are optimized for fast switching.

Dimensions in mm

Fast recovery diode recommendation

For all GTO types, ABB offers matching free-wheeling and snubber diodes. The actual choice of the diode depends on the specific application. Please see application note 5SYA 2064, Applying fast recovery diodes, on www.abb.com/semiconductors.

Silicon surge voltage suppressors

ABB's power semiconductor devices exhibit impressive robustness against inadmissibly overvoltages.

In certain applications, however, silicon surge voltage suppressors are still used today as they protect for example power thyristors against small and medium power surges (eg, 200 kW over 10 μ s) and thus allow the use of thyristors with lower voltage capability and much smaller snubber circuits.

ABB Semiconductors' silicon surge voltage suppressors feature symmetric blocking characteristics with avalanche breakdown capability and offer an effective protection against repetitive and non-repetitive overvoltages. Several types of surge voltage suppressors are available as spare and replacement parts.

Test systems for high-power semiconductors

ABB Semiconductors is well known as one of the leading suppliers of power semiconductors. Good to know that ABB Semiconductors also designs, manufactures and offers CE compliant customized power semiconductor test systems.

More than 30 years of experience and proximity to semiconductor development, production and application enable ABB to offer test systems for various environments like research & development, laboratory, production or failure analysis. Highest quality assurance, safe handling, as well as remote or on-site service capability are guaranteed.

High-power semiconductor test systems

ABB offers static and dynamic production test systems for most types of power semiconductor devices like diodes, PCTs, BCTs, GTOs, IGCTs and IGBTs. They can handle dies, substrates, submodules, modules, wafers and press-pack devices. Also reliability test systems for high temperature reverse bias, intermittent operating life or surge current tests are available. Auxiliary tester parts include clamping, capacitor discharge, pre-heating, data acquisition and parameter extraction units as well as programmable IGBT and thyristor gate units.

Parameters

The ABB test systems cover the range of up to 14 kV and 10 kA and use configurable stray inductances down to 60 nH. During testing, the clamped device under test (DUT) can be precisely heated up to 200 °C for production systems or cooled down to -40 °C in an environmental chamber for engineering systems. The clamping units can handle devices up to 240 mm in diameter and can apply a clamping force of up to 240 kN.

Automation

Our test systems are designed for easy integration into automated handling equipment. The test system's software is compatible to commercial control systems such as manufacturing execution systems (MES) and computer-aided quality assurance (CAQ).

	Blocking voltage AC or DC	Gate characteristics	On-state, forward voltage	Reverse recovery charge	Critical dV/dt	Circuit-commutated turn-off time	$V_{\text{cesat}} / V_{\text{pinch-off}}$	Turn-on / turn-off

- Data acquisition and parameter extraction units

Further information Certificates

ABB is committed to the highest ethical, environmental and business standards. ABB Semiconductors has been awarded the ISO certifications for manufacturing, design and development of high-power semiconductor devices and modules (ISO 9001, 14001 and OHSAS 18001).

Date December 1st, 2016

Declaration regarding the REACH-Regulation

With reference to the Regulation (EC) N° 1907/2006, issued by the European Union for the Registration, Evaluation, Authorization and Restriction of Chemicals (REACH), please be aware that:

- during normal and reasonably foreseeable conditions of use, products and related accessories, which are articles according to REACH, manufactured by ABB Switzerland Ltd., Semiconductors and/or ABB s.r.o., Czech Republic do not intentionally release any substance or preparation (mixtures);
- ABB Switzerland Ltd., Semiconductors and/or ABB s.r.o., Czech Republic continuously assess their products for content of Substances of Very High Concern (SVHC), as included in the "Candidate List" by the European Chemicals Agency (ECHA);
- ABB Switzerland Ltd., Semiconductors and/or ABB s.r.o., Czech Republic continuously undertake communications throughout their supply chain in order to collect information about suppliers' compliance with REACH Regulation.

According to our current best knowledge all devices of the entire product portfolio manufactured by ABB Switzerland Ltd., Semiconductors and/or ABB s.r.o., Czech Republic do not contain SVHC substances exceeding 0.1% w/w.

Relevant for our chip customers only: the dicing tape (film) as carrier for bare die products contains the following substance in concentration above the 0.1% w/w limit:

- Bis (2-ethylhexyl)phthalate (DEHP), CAS 117-81-7, EC 204-211-0.

In the event we discover that any SVHC is present above the reporting threshold, we will inform you according to the requirements of the REACH directive.

Yours sincerely,
ABB Switzerland Ltd. - Semiconductors

Dr. Jürgen Bernauer
Manager Product Group Semiconductors

Mojmir Bajous
Local Product Group Manager

Further information

Symbols

Symbol	Description
C_s	Snubber capacitance
di/dt_{max}	Maximum rate of rise or decline of on-state current
dV/dt	Maximum rate of rise of off-state voltage
F_m	Mounting force
I_c	DC collector current
I_{CM}	Peak collector current
I_F	Diode nominal mean forward current
I_{FAVM}	Max. average forward current (180° sine wave)
I_{FSM}	Max. surge peak forward current for a 180° sine wave; no voltage reapplied after surge
I_{RM}	Max. peak avalanche current for a single 180° sine wave pulse
I_{RMS}	Max. rms on-state current (AC full wave)
I_{rr}	Max. (typ. for IGBT diode) reverse recovery current
I_T	Forward current
I_{TAVM}	Max. average on-state current (180° sine wave)
I_{TGQM}	Max. turn-off current
I_{TSM}	Max. surge peak on-state current for a 180° sine wave; no voltage reapplied after surge
P_{RSM}	Max. surge avalanche power dissipation (single pulse)
Q_{rr}	Max. reverse recovery charge
r_F	Forward slope resistance
r_T	On-state slope resistance
R_{thCH}	Thermal resistance case to heatsink
R_{thJC}	Thermal resistance junction to case
R_{thJH}	Thermal resistance junction to heatsink
T_c	Case temperature
t_q	Turn-off time
T_{vj}	Junction temperature
T_{VJM}	Max. junction temperature
V_{CES}	IGBT collector-emitter voltage
V_{CESat}	Collector-emitter saturation voltage
V_{DC}	Max. DC voltage rating for 100 FIT, 100 percent duty
V_{DRM}	Max. repetitive peak forward blocking voltage
V_F	Forward voltage drop
V_{F0}	Forward threshold voltage
V_{Fmax}	Max. forward voltage drop
V_{Fmin}	Min. forward voltage drop
V_{GIN}	Input voltage of IGCT gate drive
V_R	Symmetrical peak avalanche voltage at a sinusoidal current pulse with 20 A peak, 10 μs pulse width and 60 °C junction temperature
V_{RM}	Max. repetitive peak blocking voltage
V_{RRM}	Max. repetitive peak reverse blocking voltage
V_{RSM}	Max. surge peak reverse blocking voltage
V_T	On-state voltage drop
V_{TO}	On-state threshold voltage
